^{*} During fiscal years in which the federal government runs deficits, some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.

^{*} During fiscal years in which the federal government runs deficits some spending is financed through borrowing. This creates implicit tax liabilities for states that must be repaid eventually. To incorporate these implicit tax liabilities into the analysis, the following adjustment was made to state tax burdens: First, the total federal tax burden is increased by the size of the federal deficit. Next, this total burden is allocated among states based on each state's proportion of the actual federal tax burden. Finally, adjusted spending-per-dollar-of-tax ratios are calculated by dividing actual expenditures by the adjusted tax figure, effectively making figures deficit neutral.
